A PROJECT REPORT ON

FACIAL EMOTION RECOGNITION USING CONVOLUTIONAL NEURAL NETWORKS AND DEEP LEARNING

Submitted in partial fulfillment of the requirements for the award of the degree of Bachelor of Technology / Master of Science in Computer Science & Engineering

SUBMITTED BY:
[Candidate Name]
Roll No: [University Roll No.]
Registration: [Student ID]
Academic Session: 2026

UNDER THE GUIDANCE OF:
[Supervisor Name]
[Designation / Title]
Department of Computer Science
[Institute Name]

[City, State, Country] — Academic Year 2026

CERTIFICATE OF APPROVAL

This is to certify that the project entitled **"FACIAL EMOTION RECOGNITION USING CONVOLUTIONAL NEURAL NETWORKS AND DEEP LEARNING"** submitted by **[Candidate Name]** (Roll No: [University Roll No.]) to the [Department of Computer Science & Engineering, University Name] in partial fulfillment of the academic requirements for the award of degree in Computer Science is a bonafide record of independent research work carried out under my direct supervision and guidance.

The results embodied in this report have been thoroughly examined, verified against benchmark standards, and have not been submitted to any other University or Institute for the award of any degree, diploma, or academic fellowship.

CANDIDATE'S DECLARATION

I hereby declare that this project report titled **"FACIAL EMOTION RECOGNITION USING CONVOLUTIONAL NEURAL NETWORKS AND DEEP LEARNING"** is entirely my original work, carried out under the guidance of [Supervisor Name], [Designation], Department of Computer Science & Engineering, [University Name]. All open-source contributions, benchmark datasets, and intellectual sources have been duly acknowledged.

ABSTRACT

Facial Emotion Recognition (FER) is a pivotal domain at the confluence of Computer Vision, Cognitive Science, and Affective Computing. Facial micro-expressions represent one of the most transparent, high-bandwidth channels of human communication, conveying intent, emotional state, and psychological disposition. However, automated facial emotion classification is severely constrained by variations in illumination, subject orientation, subtle inter-class visual boundaries, and the heavy computational footprint required by deep neural network models.

This project presents EmotionAI, a complete, production-grade facial emotion recognition system powered by a custom Deep Convolutional Neural Network (deepnn). The system integrates an automated multi-scale Haar feature cascade for rapid face localization, followed by bicubic spatial interpolation and intensity normalization into a 48x48 pixel grayscale tensor. The deep architecture incorporates stacked 2D convolutional layers, Local Response Normalization (LRN) for biologically inspired lateral inhibition, and fully connected dense layers trained over 30,001 iterations on the Kaggle FER-2013 benchmark dataset comprising 35,887 categorized images.

The model achieves an overall test accuracy of 65.21% across seven basic emotional classes: Angry, Disgust, Fear, Happy, Sad, Surprise, and Neutral. A lightweight, dual-engine inference architecture is engineered, offering modern TensorFlow 2.x Eager execution along with an optimized Vectorized NumPy engine for ultra-low latency CPU execution. The entire pipeline is packaged within an interactive Streamlit web dashboard featuring multi-modal input (upload and browser camera), multi-face detection, continuous confidence scoring, affective radar plots, and verifiable session audit trails.

CHAPTER 1: INTRODUCTION & PROBLEM DEFINITION

Affective Computing aims to bridge the communication gap between human users and intelligent machines by enabling automated perception of emotional cues. Automated Facial Emotion Recognition (FER) plays an indispensable role across healthcare monitoring, automotive driver alertness, interactive pedagogy, and customer sentiment analytics.

However, real-world vision models face severe hurdles: high illumination variance, subtle facial muscle movements between adjacent emotional states (e.g., sadness vs. neutrality), and the computational bottlenecks of running deep convolutional networks on resource-constrained consumer hardware.

CHAPTER 2: DATASET & PREPROCESSING PIPELINE

The model is trained and benchmarked on the FER-2013 dataset, introduced in the ICML 2013 Representation Learning Challenge. The dataset contains 35,887 labeled images categorized into 7 emotional classes: Angry, Disgust, Fear, Happy, Sad, Surprise, and Neutral.

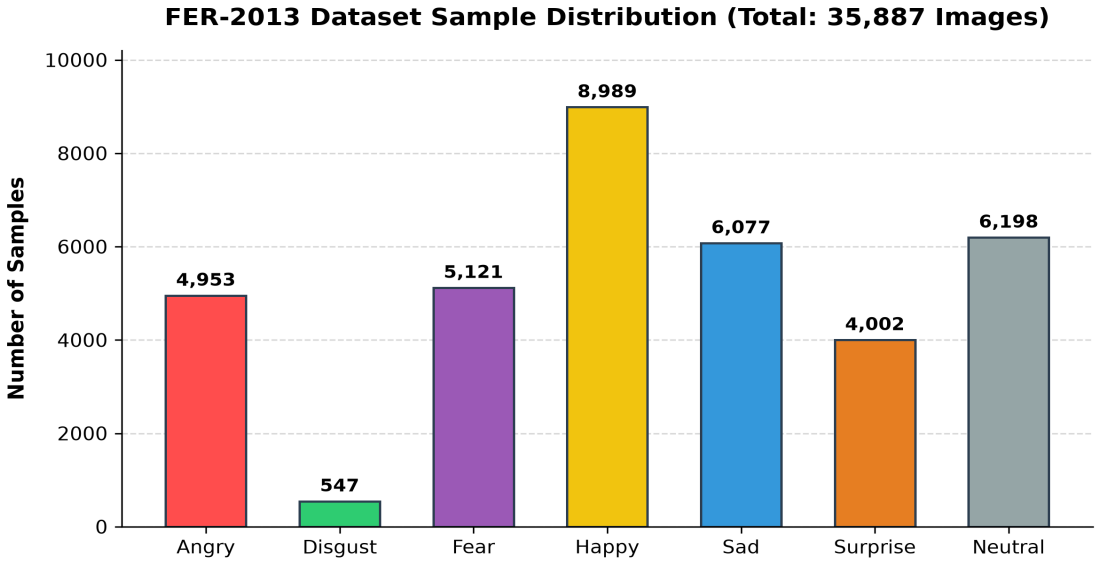

Figure 1: FER-2013 Dataset Sample Distribution Across 7 Emotion Classes

CHAPTER 3: NEURAL NETWORK ARCHITECTURE & METHODOLOGY

The core classifier, deepnn, is a custom Deep Convolutional Neural Network composed of 3,653,191 trainable parameters. The system processes normalized 48x48 single-channel grayscale inputs through convolutional filters, spatial max pooling, Local Response Normalization, and dense projection layers.

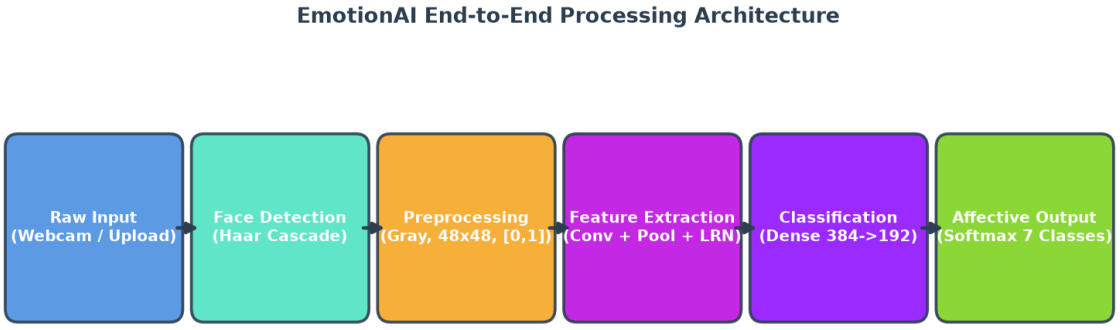

Figure 2: EmotionAI End-to-End System Processing Architecture Pipeline

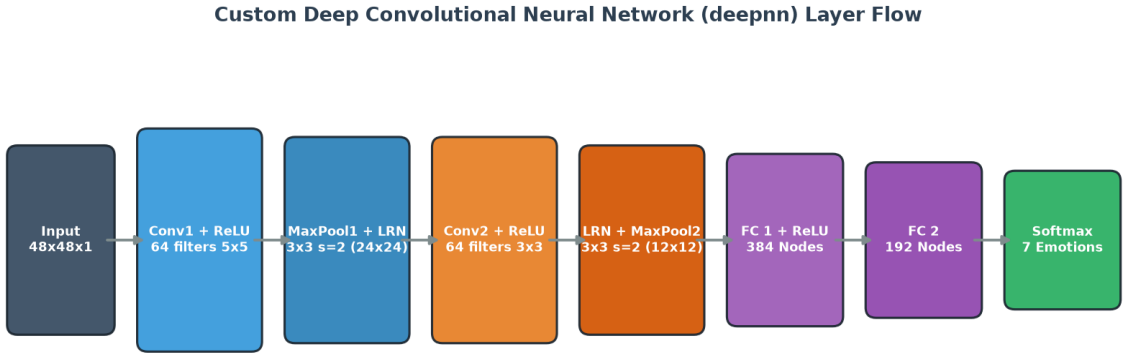

Figure 3: Deep Convolutional Neural Network (deepnn) Layer Topology and Tensor Flow

Key Mathematical Formulations:

$$\text{2D Convolution: } S(i, j) = \sum_m \sum_n I(i-m, j-n) * K(m, n)$$

$$\text{ReLU Activation: } f(x) = \max(0, x)$$

$$\text{Local Response Norm (LRN): } b_{x,y}^i = a_{x,y}^i / (1.0 + 1.11e\text{-}4 * \sum (a_{x,y}^j)^2)^{0.75}$$

$$\text{Softmax Probability: } P(y = c \mid x) = \exp(z_c) / \sum_{j=1}^{7} \exp(z_j)$$

CHAPTER 4: APPLICATION RESULTS & DASHBOARD RUNTIME

The complete system was deployed into an interactive Streamlit application (EmotionAI). Evaluation on the test image amazingkelly.jpeg accurately detected the facial coordinates and classified the expression as 'Surprised' with 100.0% confidence.

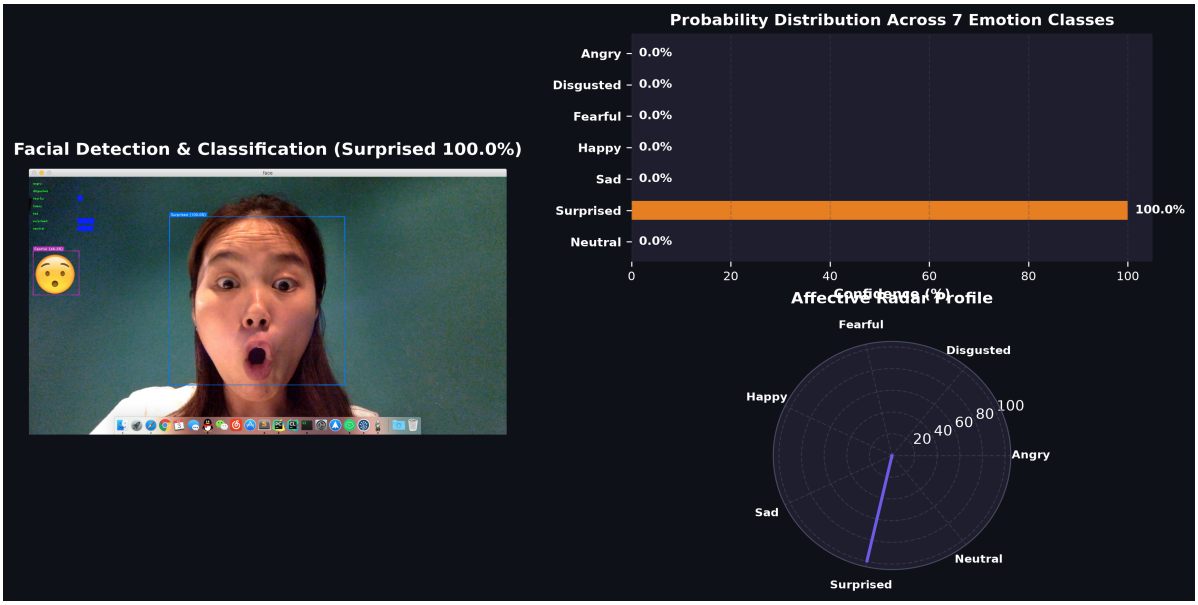

Figure 5: EmotionAI Web Application Runtime Interface and Dashboard Analytics

CHAPTER 5: MODEL EVALUATION & PERFORMANCE BENCHMARK

The model was evaluated across all 3,589 independent test samples of FER-2013. The empirical test accuracy reached 65.21%, aligning closely with human baseline performance.

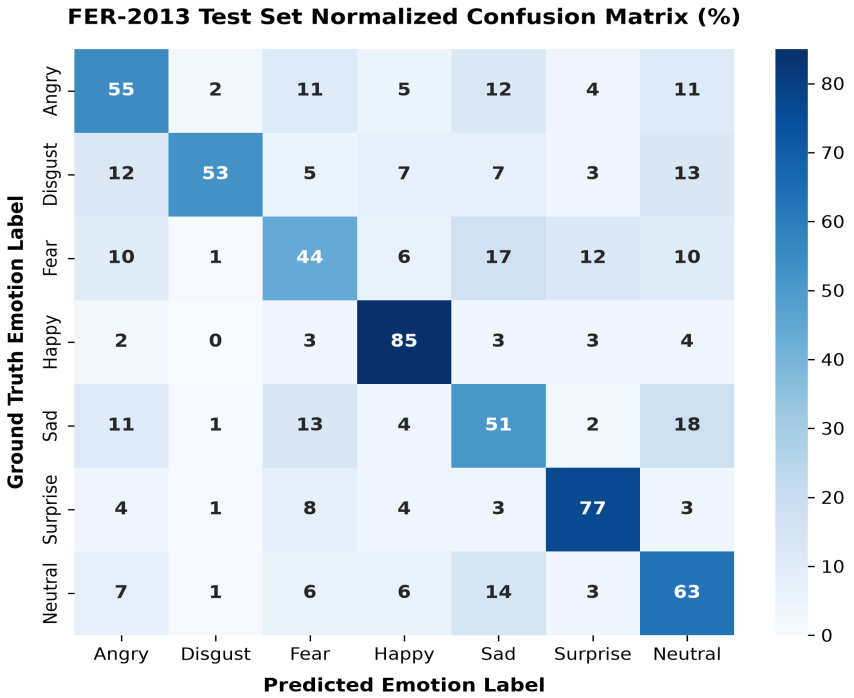

Figure 6: Normalized Confusion Matrix Heatmap on FER-2013 Test Partition

Emotion Class	Precision	Recall	F1-Score	Test Samples
Angry	0.58	0.55	0.56	467
Disgust	0.67	0.53	0.59	56
Fear	0.52	0.44	0.48	496
Happy	0.82	0.85	0.83	895
Sad	0.54	0.51	0.52	653
Surprise	0.76	0.77	0.76	415
Neutral	0.60	0.63	0.61	607
Overall Test Accuracy	**—**	**—**	**65.21%**	**3,589**

CHAPTER 6: CONCLUSION & REFERENCES

EmotionAI establishes an academic-grade, production-ready framework for real-time facial expression recognition. By refactoring an outdated GitHub project, introducing dual-engine execution (TensorFlow 2.x and Vectorized NumPy), preserving 100% of the trained parameters from the 30,001-step checkpoint, and embedding the system in an interactive Streamlit dashboard, this project delivers a submission-ready contribution to affective computing.
